

LMS Bridge

Free, open-source AI-guided remediation for any LMS — a one-page overview for decision-makers

What it is

LMS Bridge converts your LMS's assessment results into just-in-time, pedagogically constrained remediation. When a student slips on a concept, it generates a guided AI tutoring session built on retrieval practice and Socratic scaffolding. **It diagnoses and guides — it never hands over graded answers.**

Why it's low-risk to adopt

- **Free & open source** (AGPL-3.0) — no per-student fee, no size limit, full source auditable.
- **Self-hosted** on your own infrastructure; runs on **your own AI key**, so student data stays under your control.
- **FERPA-aware** with data minimization — the AI never receives names, emails, or LMS ids.

How it installs

Standards-based **LTI 1.3 / LTI Advantage** — a single integration into Blackboard, Brightspace, Canvas, or Moodle. Canvas and Moodle support one-click Dynamic Registration. Single sign-on, roster sync (NRPS), and gradebook access (AGS) work automatically; the instructor adds it to a course in one click.

What faculty and students get

Instructors see which concepts are putting students at risk and get automatic, targeted remediation at scale. Students get a private, encouraging tutor for exactly the gaps they have — before those gaps compound.

No LMS yet? Start today with Sage

Sage is an included standalone mini-LMS: an instructor creates a course, adds quizzes, and shares a join code — the adaptive tutoring works out of the box, with no IT setup, so a pilot can start this week.

Evaluate it

Live demo, per-LMS install guides, and full security & compliance documentation (HECVAT-lite, privacy/FERPA, vulnerability policy) are linked from the website. Source: github.com/hjmacemail/lmsbridge
